ScanX PSP Series

Thin, flexible, and wireless ScanX PSPs comfortably accommodate all patients and capture a larger diagnostic area with less chair time

MAKE THE SWITCH

Find out how much your practice could save by switching to a ScanX digital radiography solution.

Capturing digital images can often feel like a balancing act. Is it possible to acquire the needed diagnostics while keeping the patient comfortable and at ease? Air Techniques' ScanX Phosphor Storage Plates (PSPs) offer a simple, flexible solution for obtaining optimal diagnostics while minimizing chair time.

The driver of a growing portfolio of ScanX digital radiography systems, ScanX PSPs have a 100% active surface area, which means more anatomy is captured and fewer images are needed to acquire diagnostics. The thin and flexible PSPs offer easy positioning and ensure greater comfort for patients, especially those with limited openings or gag reflexes.

"I firmly believe that no one-sized plate, sensor, or film can fit every mouth," said Stephen Dadaian, DDS, of Dadaian Dental in Cresskill, NJ. "The ScanX PSP line offers sizes 0 to 4, depending on the size, location, and type of exposure desired by the clinician."

This flexibility allows the Dadaian Dental team to easily position ScanX PSPs in difficult anatomy and capture more surface area per exposure—leading to fewer retakes and less chair time.

"The process of taking images with a ScanX PSP is very straightforward, and the learning curve is as simple as it gets."

A High-Quality Reputation

When Dr. Dadaian's father began practicing 4 decades ago, he used Air Techniques products. "So, when we were looking to incorporate new imaging into the practice, it was a natural place to start," he shared. "We have come to know Air Techniques as a reliable, innovative brand with a proven track record."

Along with sharp image quality, ScanX PSPs offer Dr. Dadaian a workflow that's similar to that of traditional film x-rays. "The process of taking images with a ScanX PSP is very straightforward, and the learning curve is as simple as it gets," he said.

ScanX technology has delivered an excellent ROI for Dadaian Dental—not only because ScanX imaging units are robust and require little servicing—but also because ScanX PSPs are sturdily built and have a great shelf life. "When you combine the ease of use, image quality, ROI, and support, ScanX imaging technology is a very hard option to pass up," he concluded.

4 REASONS WHY DR. DADAIAN USES SCANX PSPs:

- 1 Incredibly thin, comfortable, and well tolerated by adult and pediatric patients
- 2 Extremely flexible and easy to position—resulting in fewer retakes
- 3 100% active surface area captures more imaging data per exposure
- 4 Needed diagnostics are obtained with fewer images and less chair time
